Patent No. US/20020081680A1

GENERAL INFORMATION:
APPLICANT: Xu, Jiangchun
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND
FILLE OF INVENTION: DIAGNOSIS OF PROSTATE CANCER
FILE REFERENCE: 210121.534C1

CURRENT APPLICATION NUMBER: US/09/822,827

CURRENT APPLICATION DATE: 2001-03-28

NUMBER OF SEQ ID NOS: 982

SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1182 CACGGATTTCGTGGCCGAGTG 1202

```
The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptides comprising immunogenic portions of prostate proteins used in a vaccine for the treatment of prostate cancer % \left( 1\right) =\left\{ 1\right\} =\left

                                                                                                                                                                                                                                                                                                                                                                        This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting approstate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat proceate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

immunogenic portion of a prostate tumour profein (PTP). The polypeptides and polynucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polynucleotides encoding them, antigen presenting cells which express the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polypeptides can be used as probe or to modulate the expression of the polypeptides. AAA06241 to AAA06391 and AAV82000 to AAX82020 represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and (Secretary 1). (II), and isolated to the sequence of (II), flusion proteins comprising (II), and isolated the antibodies to (II), flusion proteins comprising (II), and isolated to the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93394 and AAM01115 to AAM01118 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       463

(CORI-) CORIXA CORP. Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jian Kalos MD, Retter MW, Stolk JA, Day CH, Skeiky Y. WPI; 2001-308785/32. Isolated polypeptide comprising at least an immunog prostate-specific protein, useful in the diagnosis prostate cancer - Claim 3; Page 167-168; 325pp; English. The present invention describes an isolated polypep at least an immunogenic portion of a prostate-specific activity and can be used in variant. Also described are polynucleotides (NJ) envertion are useful in the diagnosis and nethodies from invention are useful in the diagnosis and therapy of Prostate specific genes P704P, P775P, in a genomic region on chromosome 22q11.2 known as tregion. Prostate specific antigen (PSA) P5051 was lection on chromosome 22q11.2 known as chromosome 1. AAH884611 and AAG99000 to, polynucleotide and polypeptide sequences used in the bit the present invention.

Polypeptide comprising part of the Wilm's Tumour gene product sequence is used in the diagnosis and treatment of malignant diseases e.g. leukemia and cancer associated with WTI \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes compositions comprising peptides derived from the Wilm's tumour protein WT1 and methods for their use in treating malignant diseases. Peptides derived from both the murine and human WT1 proteins are provided. The human WT1 gene is found on chromosome Ilp13,
                                                                                                                                                                                                                                     and the protein was shown to be a zinc finger transcription factor. The immunogenic peptides of the invention are particularly useful in the diagnosis and treatment of cancer and leukaemia. The present sequence is a polypeptide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     284 AIGGTCCAGAGGCTGTGGGTGAGCCGCCTGCTGCGGCACCGGAAAGCCCAGCTCTTGCTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated polypeptide (I) comprising at least an immunogenic portion of a prostate tumour antigen protein or its variant. (I) have cytostatic activity and can be used in vaccine production. (I), prostate tumour antigen polynucleotides, an antigen presenting cell (APC e.g. a dendritic cell) that expresses (I), and a pharmaceutical composition containing (I) are useful for inhibiting the development of cancer in a patient. Antibodies specific for proteins and oligonucleotides that hybridise to a polynucleotide that encodes a prostate specific protein are useful for detecting the presence or absence of a cancer or monitoring the progression the progression of a cancer, especially prostate cancer. AANU02422 to AAN12872, AAB74798 to AAN74821 and AAN14830 are sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                284 ATGGTCCAGAGGCTGTGGGTGAGCCGCCTGCTGCGGCACCGGAAAGCCCCAGCTCTTGCTG

The invention relates to isolated nucleic acid (ABNB1319-ABNB1324), corresponding to genes differentially expressed in mast cells following activation or in patients with allergic hypersensitivity disease, (I) that encodes proteins (ABB77569-ABB77575) (II) or a protein fragment of (II) if at least 6 amino acids. (II) is useful for identifying binding

partities. (1) to (1) is useful to unaquesting of tracturing actimus. (2) cate (e.g. allergic hypersensitivity, acasonal thinitis, asthma, urticaria or atopic dermatitis or mastocytosis) in a subject which involves determining the level of expression of (1) or (11). A computer system, comprising a database containing information identifying the expression level in a tissue or at least one mast cell of (1), is useful for presenting information to identify the relative expression level of (1). (11) is used as a marker to dentify the relative expression level of (1). (11) is used as a marker to defect of alleques or it and allergic response in a patient. The protein can also serve as a target that modulate gene expression or activity and as an antigen to raise polyclonal or monoclonal antibodies. (11) is useful for identifying agents that modulate expression of the protein or agents, such as agents that modulate expression of the protein or agents, such as agents beloageal activity and function of (11) and thus are useful for for alleviating disease conditions such as allergic hypersensitivity, seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis. treating a disease (II) is useful for diagnosing or 8888888888888888888

The present invention relates to methods of detecting a prostate
cancer-associated transcript in a cell from a patient. The method
comprises contacting a blological sample from the patient with
comprises contacting a blological sample from the patient with
prostate cancer-associated polynucleotides (designated PC genes) that
co them. The prostate cancer-associated polynucleotide sequences
to them. The prostate cancer-associated polynucleotide sequences
corporate cancer and are derived from the tissues of various
prostate cancer and are derived from the tissues of various
organisms such as humans or other mammals (e.g. mice, sheep and dogs).
The methods of the invention are useful for diagnosing and treating
prostate cancer in mammals. The prostate cancer associated genes are
useful for diagnosing or treating prostate cancer, as well as for
identifying modulators of prostate cancer or agents that inhibit
prostate cancer. The nucleic acid sequences are particularly useful
constate cancer. The nucleic acid sequences are particularly useful
constate cancer associated proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a prostate cancer-associated transcript in a cell in a patient, useful for diagnosing prostate cancer (PC) or screening modulators of PC, by determining if prostate cancer-associated genes are expressed in a prostate tissue
                                                                                     Prostate cancer; prostate tumour tissue; human; mammal; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mack DH, Wilson KE, Afar D, Hevezi P;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 ValAsnLeuLeuThrPheGlyLeuGluValCysLeuAlaAlaGlylleThrTyrValPro

```
The invention relates to an isolated PROST 03 polypeptide (I) and to the polynuclectide (II) encoding PROST 03. Fragments of (I) were used to generate antibodies (III) to PROST 03. (III) is useful for selectively destroying a cell expressing (I), and for treating a disease-state associated with expression of PROST 03 in a human patient. (III) is useful for diagnosing metastasis associated with (I), in a subject. (I) is also useful for diagnosing metastasis associated with (I), in a subject. (I) is also useful for diagnosing and treating diseases of cell proliferation such as prostate cancers. (I) is also useful for generating antibodies to PROST 03. (III) is useful in detecting the levels of PROST 03 containing cells. (II) is useful in diagnostic response to PROST 03 containing cells. (II) is useful in diagnostic assays for detecting the levels of polynucleotides encoding PROST 03 in cells and tissues. (II) is useful as DNA probes, as targets for antisense and ribozyme therapy, and as templates for the production of antisense polynucleotides. (I) and (II) are useful in research, biological,

The invention relates to polynucleotides encoding breast tumour polypeptides. The sequences are useful for treating cancer, preferably breast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that binds to a breast tumour polypeptide, detecting in the sample an amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient. Sequences AAU82641-AAU82655 represent human breast tumour polypeptides of the invention.
                                                                                                                                                                                                                                                              Polynucleotides encoding breast tumour polypeptides, useful for treating breast cancer or stimulating an immune response -

ACTGCCTATATGGTGTCTGCCGCAGGCCTGGGTCTGGTCGCCATTTACTTTGCTACACAG 1903
           The present invention describes an isolated polypeptide (I) comprising at least an immunogenic portion of a prostate tumour antigen protein or lis variant. (I) have extostatic activity and can be used in vaccine production. (I), prostate tumour antigen polynucleotides, an antigen presenting cell (APC e.g. a dendrittc cell) that expresses (I), and a pharmaceutical composition containing (I) are useful for inhibiting the development of cancer in a patient. Antibodies specific for prostate specific proteins and oligonucleotides that hybridise to a polynucleotide that encodes a prostate specific protein are useful for detecting the presence or absence of a cancer or monitoring the progression the progression of a cancer, especially prostate cancer. AMH02422 to AAH2872, AAB74798 to AAN174821 and AAB74830 are sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          859
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      341
                                                                                                                                                                                                                The present sequence is that of a triple fusion protein comprising, from the N terminal end, Escherichia coli thioredoxin, human ubiquitin and amino acids 55-530 of human prostate antigen P501S, followed by a histidine affainity tail. The triple fusion protein was produced in E. coli G1724 host cells transformed by an expression vector comprising DNA (see ABA91283) encoding the fusion. This is an example of the production of triple fusion proteins of the invention that comprise ubiquitin fused between thioredoxin and a protein of interest, in this case P901S(aa55-553). A claimed method of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coll) under conditions which endoporotease (especially UBP1 from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the ubiquitin-specific endoprotease in vivo. In the present case, the product is a P501-like protein of 509 amino acids. The recombinant protein of 509 amino acids. The
                                                                                                                 Novel DNA sequence encoding triple fusion protein comprising ubiquitin fused between thioredoxin and polypeptide of interest, useful for producing recombinant polypeptide of interest suitable for medicinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140 ATGACCATGGTGCTGGCCATTGGTCCAGTGCTGGGCCTGGTCTGTGTCCCGCTCCTAGGC

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used in vaccines. The antibodies or prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to inprove diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH99337 to AAH99944 and AAM01115 to exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GGCATCACCTATGTGCCGCCTCTGCTGCTGGAGTGGGGGTAGAGGAGAAGTTCATGACC 445

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              261
                                                                                                                                                                                                   The present sequence is that of a triple fusion protein comprising, from the N-terminal end, Escherichia coli thioredoxin, human ubquittin and amino acids 1-320 of human prostate antigen P501S, followed by a histidine affinity tail. The triple fusion protein was produced in E. coli G1724 host cells transformed by an expression vector comprising DNA (see ABA01284) encoding the fusion. This is an example of the production of triple fusion proteins of the invention that comprise ubjquitin fused between thioredoxin and a protein of interest, in this case F501S(aa55-553). A claimed method of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coli) under conditions which callow co-expression of the triple fusion and a ubjquitin-specific allow co-expression of the triple fusion and a ubiquitin-specific and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the

Novel isolated nucleic acids that are differentially expressed in mast cells in patients with allergic hypersensitivity, encoding proteins associated with mast cell regranulation and allergic hypersensitivity

Claim 31; Page 103-104; 119pp; English.

corresponding to genes differentially expressed in mast cells following activation or in patients with allergic hypersensitivity disease, (1) that encodes protein (ABD7759, (11) or a protein fragment of (11) if at least 6 amino acids. (11) is useful for identifying binding partners. (1) or (11) is useful for diagnosing or treating a disease strines. (1) or (11) is useful for diagnosing or treating a disease strines (e.g. allergic hypersensitivity, seasonal rhinitis, asthma, urticaria or atopic dermatitis or mastocytosis) in a subject which involves determining the level of expression of (1) or (11). A computer system, comprising a database containing information identifying the cypression level in a tissue or at least one mast cell of (1), is useful for presenting information to identify the relative expression level of (1). (11) is used as a marker to detect, diagnose or identify an allergic response in a patient. The protein can also serve as a target that modulate gene expression artitledies. (11) is useful for identifying polyclonal antibodies. (11) is useful for identifying agents that modulate expression of the protein or agents, such as agonists or antagonists. The agonists or antagonists are useful for modulating biological activity and function of (II) and thus are useful for alleviating disease conditions such as allergic hypersensitivity, seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis. invention relates to isolated nucleic acid (ABN81319-ABN81324),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides for antigenic epitopes derived from them, and antigen-presenting cells expressing the polypeptides from them, and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer. Sepecially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The present sequence is a prostate specific for the content of the content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and can be used in vaccine production and gene therapy. (I), (II), and can be used in vaccine production and gene therapy. (I), (II), and isolated (II), dission proteins comprising (II), and isolated (II) and the antibodies are also used in the detection of cancer in a patient. (I) and the cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for improve diagnostic and therapeutic (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH9344 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           526

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.

or New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autoimmune disease and cancer, and used as a food additive o preservative

Claim 11; Page 438-440; 490pp; English.

AAD05220-AAD05282 represent cDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the protein sthey encode. AAE01415-AAE01431 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 21 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, feetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune disorders, cancer, tumours, feetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune disorders, schizophrenia, asthma, skin disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders, pregnancy-related disorders, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding process. preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., raddoimmunoassay or enzyme linked immunosorbent assay (ELISA).

therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndicme, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzhahmer's, parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG65318 represent albumin fusion proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention relates to albumin fusion proteins comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein \,
                                                                                                                                                                     Albumin fusion protein; therapeutic protein X; human albumin; HA;
                                                                                                                                                                                 human serum albumin, HSA; cancer; reproductive disorder; digestive disorder: immune disorder; endocrine disorder; hadmatopoietic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinfammatory; antiinleer; immunomodulator; anti-HIV; antidiabetic; haemostatic; nootropic; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            371

                                                                           Ω
                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the of cancer and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is fusion protein comprising a prostate specific polypeptide of the invention.

New polynucleotide encoding a prostate-specific protein, for diagnosing, monitoring and treating prostate cancer in a patient and diagnosing, monitoring and treating prostate cancer in a patient and for use in vaccines.

Claim 8; Page 504-506; 543pp; English.

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, antibodies to (II), fusion proteins comprising (II), and isolated and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies for monitoring the progression of cancer in a patient. (I) can be used for improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AH1931357 to AH1931944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
